Grading Rubric — Mobile Development Course Project

29 September 2026 ·

Minh Khuê PHAN TRAN

Overview

Course project grade = 50% Assignment 01 (Specification) + 50% Assignment 02 (Implementation).

Each assignment is scored out of 100 and converted to a 10-point scale.

Assignment 02 is assessed against the team's own Assignment 01 specification, so the spec must be specific enough to serve as the acceptance baseline.

Level	Share of criterion points	Meaning
Excellent	90–100%	Complete, justified, at a professional document/product standard
Good	75–89%	All main components present, minor gaps
Satisfactory	60–74%	Basic components present but thin or unjustified
Unsatisfactory	0–59%	Key components missing or seriously flawed

Assignment 01 Rubric — Comprehensive Specification Document (100 points)

The deliverable is a single consolidated document covering everything from requirements elicitation to system architecture and UI mockups.

#	Criterion	Max	Excellent (90–100%)	Satisfactory (60–74%)	Unsatisfactory (<60%)
1.1	Problem analysis & requirements elicitation	15	Clear problem statement; stakeholders and personas; evidence of real elicitation (interviews, surveys, competitor app analysis)	Problem and users described, but mostly assumed	Vague problem; unclear who the users are or why the app is needed
1.2	Functional requirements specification	20	Use case diagram + use case specs / user stories with testable acceptance criteria; MoSCoW prioritisation	Use cases and feature list present, but acceptance criteria or priorities missing	Disconnected features that cannot be verified
1.3	Non-functional requirements & mobile constraints	10	Measurable NFRs: response time, offline behaviour, security, permissions, platform/OS versions, battery/network	Generic NFRs ("the app must be fast")	Missing or not mobile-relevant
1.4	System architecture design	20	Overall architecture (app ↔ backend ↔ external services) and in-app architecture (MVVM/Clean…); sequence diagrams for main flows; justified technology choices	Architecture diagram present but lacks justification or in-app detail	Technology names only, no design

#	Criterion	Max	Excellent (90–100%)	Satisfactory (60–74%)	Unsatisfactory (<60%)
1.5	Data & API design	10	ERD/data model, local storage strategy, API contract (endpoints, request/response, error codes)	Data model present, API only sketched	Missing or inconsistent with the features
1.6	UI/UX design & mockups	15	Complete user flows; consistent hi-fi mockups following Material/HIG; loading/empty/error states; clickable prototype; accessibility considered	Main screens covered, some inconsistency or missing secondary states	Rough wireframes, key screens missing
1.7	Traceability & document quality	10	Traceability matrix Requirement → Use case → Screen → Architecture component; consistent, professional presentation	Reasonable structure but sections cannot be traced to each other	Fragmented, many contradictions
	Total	100			

Assignment 02 Rubric — Application Implementation (100 points)

The application is accepted against the acceptance criteria and architecture the team wrote in Assignment 01.

#	Criterion	Max	Excellent (90–100%)	Satisfactory (60–74%)	Unsatisfactory (<60%)
2.1	Completeness against the spec	25	100% of Must-have and most Should-have features pass the acceptance criteria from A01	Most Must-have features done; some incomplete	Many core features missing
2.2	Architecture compliance & code quality	20	Follows the designed architecture, clear layering, sound state management; clean code; steady Git history with branches/PRs	Minor deviation from the design; works but has duplication	Code lumped together, ignores the design; commits dumped at the end
2.3	Implemented UI/UX	15	Matches the mockups; handles loading/empty/error states; works well across screen sizes	Main screens resemble the mockups, minor display bugs	Deviates heavily from the mockups, broken layouts
2.4	Data, integration & error handling	10	Real backend/API integration; handles network loss, input validation, cache/offline where specified	Integrated, but error handling is thin	Hard-coded data, crashes on network errors
2.5	Testing	10	Unit tests for core logic + manual test cases mapped to acceptance criteria, with a results report	Some tests, not mapped to the spec	No testing
2.6	Security & performance	5	Tokens/keys stored securely, permissions requested at the right time, no secrets in the repo; smooth interaction	Basic precautions	Exposed API keys, excessive permissions
2.7	Build, deployment & documentation	5	Installable build (APK/TestFlight/Expo); clear README with run instructions	Runs, but configuration must be fixed manually	Cannot be built from the repo
2.8	Demo & oral defence	10	Smooth scripted demo; every member can explain the code they wrote	Demo works, answers are hesitant	Team cannot explain its own code

#	Criterion	Max	Excellent (90–100%)	Satisfactory (60–74%)	Unsatisfactory (<60%)
	Total	100			

Additional rules

Rule	Description	Effect on grade
Change log against the spec	Every design change in A02 must be logged with its rationale	Unexplained changes are penalised under criteria 2.1 and 2.2
Gate condition	The app must build and run from the repo following the README	Does not build → A02 capped at 40/100
Individual factor	Based on peer review, Git contribution and the oral defence	Individual grade = team grade × 0.8–1.2
Use of AI tools	Permitted to the extent stated in the assignment brief; must be declared	Undeclared use or inability to explain code → considered under 2.8 and the individual factor
Late submission	Deduction per day late	Proposed 10% per day, maximum 3 days
A02 mid-term review	Teams present progress and a preliminary build	Not graded; used for early feedback
